## Given information:

[\[back to top\]](#)

**model: continuous univariate normal (Gaussian) model for the class-conditional densities**

$$p(x|\omega_j) \sim N(\mu|\sigma^2)$$

$$p(x|\omega_j) \sim \frac{1}{\sqrt{2\pi\sigma^2}} \exp \left[ -\frac{1}{2} \left( \frac{x-\mu}{\sigma} \right)^2 \right]$$

**Prior probabilities:**

$$P(\omega_1) = \frac{2}{3}, \quad P(\omega_2) = \frac{1}{3}$$

**Variances of the sample distributions**

$$\sigma_1^2 = \sigma_2^2 = 1$$

**Means of the sample distributions**

$$\mu_1 = 4, \quad \mu_2 = 10$$

## Deriving the decision boundary

[\[back to top\]](#)

**Bayes' Rule:**

$$P(\omega_j|x) = \frac{p(x|\omega_j) * P(\omega_j)}{p(x)}$$

## Bayes' Decision Rule:

Decide  $\omega_1$  if  $P(\omega_1|x) > P(\omega_2|x)$  else decide  $\omega_2$ .

$$\Rightarrow \frac{p(x|\omega_1) * P(\omega_1)}{p(x)} > \frac{p(x|\omega_2) * P(\omega_2)}{p(x)}$$

We can drop  $p(x)$  since it is just a scale factor.

$$\Rightarrow P(x|\omega_1) * P(\omega_1) > p(x|\omega_2) * P(\omega_2)$$

$$\Rightarrow \frac{p(x|\omega_1)}{p(x|\omega_2)} > \frac{P(\omega_2)}{P(\omega_1)}$$

$$\Rightarrow \frac{p(x|\omega_1)}{p(x|\omega_2)} > \left( \frac{\frac{1}{3}}{\frac{2}{3}} \right)$$

$$\Rightarrow \frac{p(x|\omega_1)^{\frac{2}{3}}}{p(x|\omega_2)^{\frac{1}{3}}} > 1$$

$$\Rightarrow \frac{2}{3} \cdot \frac{1}{\sqrt{2\pi\sigma_1^2}} \exp \left[ -\frac{1}{2} \left( \frac{x-\mu_1}{\sigma_1} \right)^2 \right] > \frac{1}{3} \cdot \frac{1}{\sqrt{2\pi\sigma_2^2}} \exp \left[ -\frac{1}{2} \left( \frac{x-\mu_2}{\sigma_2} \right)^2 \right]$$

Since we have equal variances, we can drop the first term completely.

$$\Rightarrow \frac{2}{3} \cdot \exp \left[ -\frac{1}{2} \left( \frac{x-\mu_1}{\sigma_1} \right)^2 \right] > \frac{1}{3} \cdot \exp \left[ -\frac{1}{2} \left( \frac{x-\mu_2}{\sigma_2} \right)^2 \right] \quad \left| \ln, \quad \mu_1 = 4, \quad \mu_2 = 10, \quad \sigma = 1 \right.$$

$$\Rightarrow \ln(2) - \ln(3) - \frac{1}{2}(x-4)^2 > \ln(1) - \ln(3) - \frac{1}{2}(x-10)^2 \quad \left| + \ln(3), \cdot (-2) \Rightarrow -2\ln(2) + (x-4)^2 < (x-10)^2 \right.$$

$$\Rightarrow x^2 - 8x + 14.6137 < x^2 - 20x + 100$$

$$\Rightarrow 12x < 85.3863$$

$$\Rightarrow x < 7.1155$$

## Plotting the class conditional densities, posterior probabilities, and decision boundary

[\[back to top\]](#)

```
In [2]: %pylab inline

import numpy as np
from matplotlib import pyplot as plt

def pdf(x, mu, sigma):
    """
    Calculates the normal distribution's probability density
    function (PDF).

    """
    term1 = 1.0 / ( math.sqrt(2*np.pi) * sigma )
    term2 = np.exp( -0.5 * ( (x-mu)/sigma )**2 )
    return term1 * term2

# generating some sample data
x = np.arange(0, 100, 0.05)

# probability density functions
pdf1 = pdf(x, mu=4, sigma=1)
pdf2 = pdf(x, mu=10, sigma=1)

# Class conditional densities (likelihoods)
